

Eco-Solar Home Tour 2024

Sunday 2 June, Noon to 5 pm

St Albert NZE Retrofit Home

Tour Day: Sun 2 June

Address:

Hosts: Homeowners

Parking: on street

Energuide: 5 GJ/year

What will people see and learn about at your home?

- LiteZone window assemblies – invented (and patented), engineered and produced in Edmonton. LiteZone windows have achieved a European “Passive Home” designation.
- Electrical service upgrade from 100 amp to 200 amp – Leviton panel installed
- Roof mounted solar array system – LG panels
- Ground sourced geo-exchange system – NetZero brand (EcoForest brand in Europe)

Eco-Solar Home Tour 2024

St Albert NZE Retrofit Home

Why is this home on the tour?

The home was purchased in 2022 with the intent on retrofitting it to achieve true net-zero (no offsets) energy performance. This 3100 sq.ft (290 sq.m including both levels) walk out bungalow was constructed in 1996 to the then applicable building codes. Our project approach, which I general contracted myself, was to a) reduce the energy required to operate the home b) install ground sourced geo-exchange HVAC and c) generate as much solar power as practically feasible.

The historical energy consumption was 206 GJ/year compared to the post retrofitting consumption of 64 GJ/yr. – a 69% reduction. The single largest factor contributing to this consumption reduction was the use of LiteZone glass units installed in Duxton fiberglass framed windows to replaced most of the 26 upgraded window assemblies. High grade triple glazed units with fiberglass were used for the operating windows.

The solar array generates 59 GJ/year leaving a net annual energy consumption of 5 GJ. The combined solar panel maximum rating is 17.6 kW.

The geo-exchange system has a capacity of 5 tons providing heat for the house and the 450 sq.ft garage. It also generates all the domestic hot water without augmentation. The heat pump unit is a fully variable design and does not require a buffer tank.

What features save on energy costs?

- Insulation upgraded from R34 to R56 (R56 effective or R70 nominal).
- Air tightness reduced from 2.6 to 1.7 air exchanges per hour.
- Windows and one door were replaced.
- All HVAC functions which include air handlers, hydronic lower level heating, garage heat and domestic hot water are provided by the heat pump system – overall average COP of 4.5:1 (actual per system meters, September/2023 to mid-January/2024).
- The solar generation is sufficient to offset electrical energy consumption.
- The garage retrofits included upgraded triple glazed window, insulated pony walls, and 2” thick polyurethane filled overhead doors (2)
- There is no longer any gas service to the property which eliminates all gas utility charges along with the carbon tax.

What features save on water costs?

- All toilets rated at 4.8L/flush.
- Rainwater capture into 450 litre tank.
